for NaSTEC '96.**

See page 40 for details.

NaSPA Mission Statement:

The mission of NaSPA, Inc., a not-for-profit organization, shall be to serve as the means to enhance the status and promote the advancement of all corporate computing technical professionals; nurture member's technical and managerial knowledge and skills; improve member's professional careers through the sharing and dispersing of technical information; promote the profession as a whole; further the understanding of the profession and foster understanding and respect for individuals within it; develop and improve educational standards; and assist in the continuing development of ethical standards for practitioners in the industry.

The information and articles in this magazine have not been subjected to any formal testing by NaSPA, Inc. or Technical Enterprises, Inc. The implementation, use and/or selection of software, hardware, or procedures presented within this publication and the results obtained from such selection or implementation, is the responsibility of the reader.

Articles and information will be presented as technically correct as possible, to the best knowledge of the author and editors. If the reader intends to make use of any of the information presented in this publication, please verify and test any and all procedures selected. Technical inaccuracies may arise from printing errors, new developments in the industry and/or changes or enhancements to components, either hardware or software.

The opinions expressed by the authors who contribute to **NaSPA Technical Support** are their own and do not necessarily reflect the official policy of NaSPA, Inc. Articles may be submitted by members of NaSPA, Inc. The articles should be within the scope of host-based, distributed platforms, network communications and data base, and should be a subject of interest to the members and based on the author's experience. Please call or write for more information. Upon publication, all letters, stories and articles become the property of NaSPA, Inc. and may be distributed to, and used by, all of its members.

NaSPA, Inc. is a not-for-profit, independent corporation and is not owned in whole or in part by any manufacturer of software or hardware. All corporate computing professionals are welcome to join NaSPA, Inc. Membership rates are \$29.95/year (USA), \$44.95/year (Canada) and \$54.95/year (all other countries). \$19.98 of your annual dues is allocated to the publication **NaSPA Technical Support** and is non-deductible therefrom.

NaSPA Technical Support (ISSN 1079-3135) (IPM Agreement Number 0806773) is published monthly by Technical Enterprises Inc., 7044 S. 13th Street, Oak Creek, WI 53154-1429. Second-class postage paid at Oak Creek, WI and additional mailing office. POSTMASTER: Send address changes to **NaSPA Technical Support**, 7044 S. 13th Street, Oak Creek, WI 53154-1429.

All product names mentioned in this publication are the trademarks/registered trademarks of their respective manufacturers.

FEATURES

27 Evolution of Automated Operations

This article, which focuses on MVS/XA and MVS/ESA operating systems, will examine automation, its history, and how different automation solutions are being applied.

By Richard Solomon

38 Host-to-Client/Server Network Connectivity: TCP/IP is Key

TCP/IP is increasingly being chosen as the networking protocol of choice for linking disparate platforms and for consolidating multiprotocol LANs. This protocol has become the market standard, being native to virtually every operating system, including UNIX, Windows NT, Windows 95, Macintosh, and OS/2.

By Chris Markle

48 Protecting Valuable Corporate Information Resources Through Automated Storage Management

By removing the possibility of human error through the use of an automated storage solution, such as a tape autochanger, it is possible to protect the ever-increasing amounts of distributed corporate data stored on client/server networks.

By Edward B. Cooper

SYSTEM STRATEGIES

12 ISPF Client/Server - Part I: Download and Startup

The client/server feature of ISPF Version 4 offers the same features as previous versions, but adds new functionality through Graphical User Interfaces.

By Robert Simpson

22 Year 2000: Change Strategies

This article addresses a specific subset of the year 2000 project: conversion strategies to accommodate four-digit years.

By Gerhard Adam

34 Logical and Physical Index Concepts: Part I — Logical Aspects of Database Indexing

This article, the first in a two-part series, defines the logical aspects of database indexing.

By Jim Moore

INTEROPERABILITY INSIGHTS

17 **OpenEdition MVS: The System, the Strategy, the Significance: Part I — Overview**

Why combine MVS and UNIX into one comprehensive system? Simply because OpenEdition MVS eliminates UNIX's shortcomings of scalability, stability, and manageability.

By Bill Carico and Willem J. van der Zel

29 **RUMBA for the Mainframe: The Ethernet Connection**

This article examines the steps necessary to configure RUMBA for the Mainframe to run on an Ethernet network Token-Ring network via a 3745 front-end processor running Windows 3.1 and connected to an Ethernet segment.

By John E. Johnston

42 **Future Interconnection Strategies: Part I - The Basics**

This historical overview of telecommunication services examines how new and emerging technologies are replacing older, outdated technologies to provide new levels of productivity to end users.

By Leo A. Wrobel

44 **VM and UNIX From a Systems Administration Perspective: Part III — UNIX Security: Not Just Another Pretty Oxymoron**

This article, while not a detailed tutorial on UNIX system security, does present some resources that proved helpful for this site's move toward an open systems environment.

By Daniel P. Martin

50 **Job Streams "To Go" Using REXX/VSE**

There's almost no limit to what you can do with VSE/REXX, and you'll find that REXX is ideally suited for automating computer operations.

By Linda Dockstader

54 **Establishing an Internet Presence: Part II — Obtaining IP Addresses and Domain Names**

For organizations that want to get out on the Net, there are a number of options available for applying for and obtaining IP addresses and a domain name.

By Guy C. Yost

ATTENTION READERS!

For faster response to your advertising and information inquiries, we have moved the Reader Response Card inside the magazine to page 69.

This will allow us to process your information quicker and provide you with the requested materials sooner.

Cutting the FAT

BY MICHAEL NORTON

One of the consequences of IBM's misguided strategy to compete with Microsoft in the desktop market was the introduction of OS/2 systems on numerous machines using the antiquated File Allocation Table (FAT) system. The new user's introduction to OS/2 was, unfortunately, a blue screen proffering an "easy" install option (the default) over the "advanced" install option. This included an ominous warning about needing to be a technical dweeb/2 to even attempt such a thing (with the implication, don't bother calling IBM if you encounter any difficulties because you were warned). This meant that most users installed ATDT942-7278 OS/2 with the dual-boot option in their existing DOS/Windows partition, which, by definition, used the FAT file system.

OS/2'S RELIANCE ON EXTENDED ATTRIBUTES

OS/2 should be run on an HPFS partition. The OS/2 operating system relies heavily on the use of extended attributes (EAs) to maintain its object-oriented associations. Your desktop, for example, consists largely of extended attributes contained in the DESKTOP directory structure. Extended attributes are "built in" to the HPFS file system; for FAT they are merely an afterthought.

Let's look at how FAT handles extended attributes. If you add an extended attribute to a file (i.e., the .LONGNAME standard extended attribute), the actual data is not written to (or even with) the file. Instead, it is written to a free allocation unit on the volume as independent data. This data is then associated with the file by a pointer in an area of the file's directory entry that is unused by DOS. The allocation unit in the FAT is then assigned to the system file EA_DATA._SF to prevent the data from being used by the operating system for new or appended files. Note that an entire allocation unit is assigned to the EA. Thus, simply assigning a long file name to a file consumes 8 KB of disk space on volumes using 8 KB clusters (which is fairly typical)! This is the reason many OS/2 users running on the FAT file system report absurdly large EA_DATA._SF files.

**There are, indeed,
a number of other
advantages to running
HPFS instead of the
FAT file system,
but, alas, print space,
like disk space, is finite
and my soap box
is only so tall.
If you are using
the FAT file system,
I hope you will reconsider,
especially on
your boot volume.
You will experience fewer
problems with HPFS.**

EAS ON AN HPFS VOLUME

Contrast this cumbersome and inefficient method of handling EAs to that employed by HPFS. In HPFS, each file is assigned its own header, a one-sector construct called the F-node, which immediately precedes the file data on the volume. The F-node contains the file name (including the long name) and allocation information in addition to the file's extended attributes. Because of this intimate association between a file and its F-node, it is much more difficult to lose or corrupt EAs on an HPFS volume than on a FAT volume. Additionally, since typically only the 512-byte F-node is used to contain EAs (although more space may be allotted if required), there is a marked improvement in storage efficiency.

This improvement is not limited to EAs; the FAT file system is notoriously wasteful of disk space because of short-sightedness in its design. Any file system performs two vital functions: maintaining an "index" of each file's location on the volume, and managing

free space to prevent existing data from being overwritten. Although it must have seemed ingeniously clever at the time, the design strategy taken by FAT to combine these two functions in a single allocation table has yoked FAT ever since. On FAT16 systems (there were earlier incarnations that were even worse), two bytes are assigned to each allocation unit — originally a disk sector. Each allocation unit points to the next allocation unit assigned to the file or indicates the current allocation unit is the last assigned to the file. The two-byte design implies that the volume size is limited to 32 MB, since the last allocation unit that could theoretically be pointed to is 0xFFFF. To break the 32 MB barrier, FAT increased the size of the allocation unit from the 512-byte sector to the cluster, which is typically comprised of 16 sectors. Thus, a one-byte file occupies more than 8 KB of disk space.

HPFS was one of those rare moments in the computer industry when mistakes were admitted and learned from. HPFS abandoned the strategy of using the allocation table to maintain file location information and manage free space.

Instead, HPFS uses a bitmap, with one bit representing each sector, to indicate sectors in use, and a file's allocation information is maintained in its F-node. This design allows HPFS to utilize the sector rather than the cluster as the basic allocation unit. The same one-byte file which consumes 8 KB under FAT uses 1 KB under HPFS (one 512-byte sector for the data and another sector for the F-node).

The decentralization of allocation information has another, more important consequence: decreased susceptibility to catastrophic data loss. The FAT is obviously the most heavily used area on a FAT volume, and is written and rewritten constantly. With each access, the odds increase of something going awry, and, when it does, the damage is not limited to the file currently being allocated, but potentially all files on the volume. Moreover, if the FAT is corrupted, recovery is only possible through tedious and prohibitively costly measures. With HPFS, the interspersing of allocation information virtually prevents such

(continued from page 66)

massive data loss, and allows the possibility of recovery of much, if not all, of the volume data through the use of disk utilities such as SoftTouch System's GammaTech Utilities or Warp Speed's Graham Utilities.

There are, indeed, a number of other advantages to running HPFS instead of the FAT file system, but, alas, print space, like disk space, is finite and my soap box is only so tall. If you are using the FAT file system, I hope you will reconsider, especially on your boot volume. You will experience fewer problems with HPFS. **ts**

Michael Norton is the workstation division manager at SoftTouch Systems, which provides

both mainframe and PC software solutions. He has written mainframe manuals in addition to articles in a number of publications. You can reach him at mnorton@softtouch.com.

(continued from page 65)

about this, it makes sense. The two MSEngines always arrive at the same results. If a particular event causes the primary MEngine to crash, that same event will lead to the crash of the secondary MEngine.

SFT III must be viewed as an added layer of protection against hardware errors. Many of us use mirror NetWare disk partitions to protect against hardware errors on our disk drives. SFT III takes this concept one step further by allowing us to mirror the entire server. **ts**
